Abstract of TW 457432 (B)

A method to resolve the interrupt problem of data stream and the device thereof are disclosed, wherein a digital signal controller is used to transmit the data in the storage unit, and the digital signal controller comprises the base register unit and the trigger register. The method comprises: firstly, writing the initial address value of data into the base register unit during transmitting the data; next, triggering the digital controller, modifying the content of the trigger register, and returning to the initial step and the next step of the present invention; then, the digital controller sending the corresponding data to the initial address value in the base register unit, and when the digital controller completes transmitting the data, going to the next step; and finally, when the content of the trigger register changes, repeating the previous step.
